7000 Series Label Applicator

Warranty:
The 7000 Series Label Applicator, including all components unless otherwise specified, carries a limited warranty.

For all warranty terms and conditions, contact the manufacturer for a complete copy of the Limited Warranty Statement.
Section 1: Safety

Safety awareness is critical when working with equipment that contains moving parts and extending electric actuators. Please read all warnings and cautions thoroughly before operating this device.

Following is a list of safety symbols and their meanings, which are found throughout this manual. Pay attention to these symbols where they appear in the manual.

Wear safety goggles when performing the procedure described!

Caution or Warning! Denotes possible personal injury and/or damage to the equipment.

Caution or Warning! Denotes possible personal injury and/or equipment damage due to electrical hazard.

NOTE: (Will be followed by a brief comment or explanation.)

ESD protection should be worn when servicing internal printed circuit boards.

After service to the equipment is completed, replace all protective devices such as grounding cables and covers before operating the equipment.

Caution or Warning! Denotes possible personal injury due to heat.

Caution or Warning! Denotes possible personal injury due to pinching/crushing.

Caution or Warning! Denotes possible personal injury due to pinching/crushing.

WARNING! Tipping hazard: Tie-down cleats (4600-625) are required to be secured to the ground when using this product on non-flat or uneven surfaces and/or where the center of mass may cause an unsafe condition.
WARNINGS

• WARNING - Moving parts of this machine can present hazards. Components that cannot be guarded because of loss of functionality are marked with a warning symbol.

• Be aware of the actuator extension distance, and avoid accidental triggering of the photosensor.

• When servicing the unit’s electronic assemblies, always remove the power cord from the unit to prevent accidental shock.

• When running for extended periods of time, use caution when accessing the drive module circuitry. The motor drive power transistors, motor case, and motor heatsink can become hot under constant use.

• Wear personal protective equipment, as instructed by your supervisor, when operating or working near this device.

• A connection to a grounded power outlet is required. The power outlet should remain accessible after installation for emergency power disconnect.
Contents:
* Main Applicator
* Product Detector Kit
* Power Cord
* Manual (Digital Copy)
Caution: System is top heavy; take care when adjusting roll. Tie-Down Cleats (4600-625) are recommended to secure Stand and Applicator into place while in use.
ORIENTATIONS

Using the Yoke Mount Nut, Yoke Ear Bolts and Yoke Mount Setscrews, adjust the Label Applicator to the desired orientation.

- **TOP DOWN** (RIGHT HAND)
- **NOSE UP** (RIGHT HAND)
- **NOSE DOWN** (RIGHT HAND)
- **SIDE APPLY** (RIGHT HAND)
**Step 2: System Alignment**

**WIPE**

1. Verify leading edge of peel blade is parallel with product.
2. Verify label direction is parallel with conveyor direction.

**TAMP**

Pad should extend and lay flat against product.
**Step 3: Position Product Detector**

**MACHINE MOUNTING**

**PRODUCT DETECTOR SETUP**

1. To detect product present (Leading Edge), turn Light On/Dark On Selector to L. To detect product absent (Trailing Edge), turn Light On/Dark On Selector to D.

2. Turn Sensitivity Adjuster full counterclockwise.

3. Put a product on the conveyor at the expected distance from product detector during production.

4. Turn Sensitivity Adjuster clockwise until both Power Indicator and Output Indicator are on and solid when product is in front of sensor for Leading Edge, and absence of product for Trailing Edge.

5. Remove product.

6. Verify that detector does not sense movement beyond the far edge of the product. (If so, repeat steps 2 through 6.)
**Step 4: Position Nip Roller**

1. Using snap ring pliers, remove the outer Snap Ring and Washer.
2. Remove the Nip Roller.
3. Position the inner Snap Ring and Washer to allow the Nip Roller to be placed in the center of the liner.
4. Re-install the Nip Roller, followed by the Washer and then the Snap Ring. Seat the Snap Ring snugly.

**NOTE:** The position of the nip roller is critical to the tracking of the liner through the system. Placing the nip roller too close to one edge of the liner will cause the liner to track in that direction. When used in the Side Apply application, some adjustment of the nip roller may be required on larger labels to compensate for the weight of the liner pulling downward throughout the system.
Step 5: Load Media

1. Push Supply Roll all the way against Unwind Hub.

2. Web Label Liner around Spindle 1.

3. Web Label Liner over Spindle 2.

4. Using the Hold-Down Lever to lift the Hold-Down Plate, feed the Label Liner under the Hold-Down Plate and through the gap sensor located at the end of the peel blade. (For Wipe Systems, ensure Label Liner runs under Peel Blade Mount.)

5. Ensure that Nip Lever is open (back toward label supply). Web Label Liner around Drive Roller and Nip Roller as shown.

6. Wrap Label Liner around rewind hub as shown.

7. Insert Rewind Clasp over Label Liner, and while holding the Liner, turn Rewind until the Liner grips the Rewind.
NOTE: Remove the leading three feet of labels to reduce the chance of labels sticking to the rollers.
8. Press in all Spring Collars to guide the Liner.

9. Replace Brush to apply tight tension on the Liner.

10. The Nip Lever should be in the home position against the Drive Roller.

**NOTE:** This Label Applicator operates with type 1, 2, 3 and 4 labels. Be conscious of your application when ordering labels.
Step 6: Calibrate Gap Sensor

1. Remove leading label so only liner is below Gap Sensor.

2. Press **LABEL** from the Home Screen.

3. Press **Gap Sensor**.

4. Review the message, then press the message box to close **MSG 36**.

5. Press the **Calibrate** button.
   - Success: The Status LED flashes green, followed by **MSG 37**.
   - Failure: The Status LED flashes red, followed by **MSG 38**.
Step 7: Set Speed

1. Press **Feed Speed** from the Label Menu.

2. Enter speed value in cm/s or Feet Per Minute (FPM) then press OK.

**NOTE:** For a Wipe Application, insert the conveyor speed; for a Tamp Application, insert 76 cm/s (150 FPM). Adjust as needed.

Step 8: Set Dispense Position

1. Press **Dispense Position** from the Label Menu.

2. Enter a value for the **Dispense Position** in units of 1/10mm (1/100"). This value is the distance the liner has to travel after seeing Gap to align the next label at the edge of the peel blade. (Standard Labels: 12,7 to 19,1mm [0.5 to 0.75"])  

3. Press the **Force Feed** button on the Label Menu to check that the value settings for Steps 5 to 7 have taken effect. One label will feed at the set speed and the next label will stop at the edge of the peel blade.
Step 9: Set Rewind Tension

Change **Rewind Tension** in the Label Menu to desired value. This setting will depend on the feed speed, label length and the liner material type (see LABEL MENU setup in Appendix B: Application Methods).

Step 10: Set Product Delay

1. Press **Setup** from the Home Screen, then press **JOB**.

2. Press **Apply Delay**.

3. Set the delay from when the Product Detector triggers to when the Labeler applies a label, in milliseconds. Press OK. (See SETUP/JOB MENU for the appropriate applicator in Appendix B: Application Methods.)
Step 11: Set Apply Duration (Tamp Applicator only)
Press SETUP from the Home Screen, then press JOB.

NOTE: See Appendix B for more Actuator adjustments.

1. Set Auto Retract to 0.
2. Place a stationary product in front of the tamp pad.
3. Place system on-line by pressing the green RUN button.
4. Manually trigger product detector with your hand.
5. Adjust Apply Duration.
6. Repeat steps 4 and 5 until label adheres to product, but product is not hit too hard.

Step 12: Set Actuator Distance Limit (Tamp Applicator only)
Press SETUP from the Home Screen, then press JOB.

NOTE: The Distance Limit is a safety feature used to reduce damage to the machine and product.

1. Press ACTUATOR SETUP.
2. Measure the distance from tamp pad face to product face and add 12,7mm to 25,4mm (1/2” to 1”).
3. Set Distance Limit to the whole number value.
4. Press Distance Limit Fine to make distance adjustments in 6mm (1/4”) increments.
Step 13: Set the System Online

Press the RUN button from any screen. The system is ready to apply labels when the background turns green.

Press the STOP button from any screen to stop the system from applying a label.

NOTE: Any changes made to the settings are permanently saved when Home is pressed. If Home is not pressed, the setting will be temporary.
## Maintenance Schedule Chart

(See drawings on the following page.)

<table>

7000 Series Label Applicator Operations Manual Rev A
Appendix B: Application Methods

E-TAMP Mechanical Setup

ALIGN TO PEEL BLADE

1. Loosen both screws on the dovetail slider (A).
2. Slide actuator assembly toward and away from peel blade until there is approximately 3,2mm (1/8") gap.
3. Tighten both screws (A).

ALIGN LABEL WITH TAMP PAD

1. Loosen both screws on the tamp actuator L-bracket (B).
2. Slide the actuator assembly toward and away from the baseplate until the label present sensor will be covered by a fed label.
3. Tighten both screws on the tamp actuator L-bracket (B).

ALIGN TAMP PAD HEIGHT

1. Loosen the jam screw on the actuator rod.
2. Adjust the bumper height by turning the bumper so that the face of the peel blade is 1,6mm (1/16") BEYOND the peel blade.
3. Power on the Label Applicator to verify tamp pad home position.
4. Tighten the jam screw.
E-TAMP Parameter Setup

E-TAMP applications allow the label to be placed on the Top, Side or Bottom of a product. Typically, these are applying only one label to a product, but two can be applied as well.

**LABEL MENU** - Enter LABEL Menu from the Home Screen.

- **Std** for rectangular labels with 3.2mm (1/8”) gap or **Odd** for any shape label that passes gap sensor.

- Sets the amount of tension applied to the rewind on a feed cycle. Set lower for speeds less than 100 FPM or labels shorter than 101.6mm (4”).

- Sets the distance the liner has to travel after the gap for the next label to align at the edge of peel blade. For standard labels usually set to 12.7mm to 19.1mm (0.5” to 0.75”).

**SYSTEM MENU** - Enter SYSTEM Menu from the Setup Menu.

- **E-Tamp** will be chosen for this application.

- **Yes** will offset the label placement from the front. If the product lengths vary, and the label needs to be placed off of the trailing edge of the product, set to **No**.

- **Sets the rewind motor and the drive module motor direction.**

- **Set to the length of the actuator.**

- **Sets the direction of the Actuator motor. This setting matches the A/B configuration of the actuator.**

Determines the label generation mode. For slow applications, like pallets, make this **P1 Detect**. This will reduce the time the label adhesive is exposed to air and drying. For highest throughput, use **At Home**. Use **P2 Detect** for the highest accuracy (by using two detectors) when feed on demand is required. **Then Apply** feeds a label when actuator is at Home position, then applies immediately.

Depends on the product speed and PPM. Set for fastest throughput for the application.
SMART MENU - Enter SMART Menu from the Setup Menu.

Determines if the system is being used with the optional Label Present sensor.

Determines measurement units (Standard or Metric).

Determines how many times the label will be fed without an application. The available options are 1, 2, 3 and Infinite. To ensure a 1 Label to 1 Product match, set this to 1.

Provides a warning if the system is online with a prior label on the tamp pad. Helps avoid a potential label to product mismatch.

SETUP/JOB MENU - Enter JOB Menu from the Setup Menu.

Keep as small as possible by locating the product sensor as close to the peel blade as possible. Exception - if print on demand is used.

Controls the extension stroke time. Set Auto-Retract to zero to properly adjust this time, then re-enable Auto Retract.

Most E-Tamp applications will not need much Home Delay. Large label sizes will benefit with a minimal delay of 20 mS to 100 mS.

If installed, the Auto-Retract (AR) time depends on the Actuator Speed. Speeds higher than Medium should not use the AR. Low to Medium speeds benefit from AR, and typical values range from 1 mS to 100 mS.
**ACTUATOR SETUP MENU**

Press **ACTUATOR SETUP** from SETUP/JOB Menu.

Sets the furthest extension of the tamp for the application with steps of one inch. Use this limit if the product distance to the labeler is consistent.

If enabled, the pad vibrates during label feed to help thicker labels or with stronger adhesive feed on the pad properly.

Sets the furthest extension of the tamp with 6mm (1/4”) steps.

Sets the overall speed of the Actuator to five discrete values, and depends on the application speed and through put.

**Note:** For most tamp applications, this value should be zero. For slow line speed applications, this value can be used to keep the pad in contact with the product longer, but with weaker (non-crushing) force. Holds the last position, versus continuing forward.

See chart below for recommended setting:

E-TAMP/BLOW Mechanical Setup

ALIGN TO PEEL BLADE

1. Loosen both screws on the dovetail slider (A).
2. Slide actuator assembly toward and away from peel blade until there is approximately 3,2mm (1/8") gap.
3. Tighten both screws (A).

ALIGN LABEL WITH TAMP PAD

1. Loosen both screws on the tamp actuator L-bracket (B).
2. Slide the actuator assembly toward and away from the baseplate until the label present sensor will be covered by a fed label.
3. Tighten both screws on the tamp actuator L-bracket (B).

ALIGN TAMP PAD HEIGHT

1. Loosen the jam screw on the actuator rod.
2. Adjust the bumper height by turning the bumper so that the face of the peel blade is 1,6mm (1/16") BEYOND the peel blade.
3. Power on the Label Applicator to verify tamp pad home position.
4. Tighten the jam screw.
E-TAMP/BLOW Parameter Setup

E-TAMP/BLOW applications allow the label to be placed on the Top or Side of a product. Typically, the label is transferred in a contact-less manner to the product. Alternatively, the tamp pad can make contact with the product and then blow (tamp-touch-blow) to help place a label into a recess or void area.

LABEL MENU - Enter LABEL Menu from the Home Screen.

**Std** for rectangular labels with 3.2mm (1/8") gap or **Odd** for any shape label that passes gap sensor.

Sets the amount of tension applied to the rewind on a feed cycle. Set lower for speeds less than 51cm/s (100 FPM) or labels shorter than 101.6mm (4").

Sets the distance the label will travel after gap sensor is triggered. For standard labels usually set to 12.7mm to 19.1mm (0.5" to 0.75").

SYSTEM MENU - Enter SYSTEM Menu from the Setup Menu.

Sets the rewind motor direction.

Set to the length of the actuator.

Sets the direction of the Actuator motor. This setting matches the A/B configuration of the actuator.

Determines the label generation mode. For slow applications, like pallets, make this **P1 Detect**. This will reduce the time the label adhesive is exposed to air and drying. For highest throughput, use **At Home**. Use **P2 Detect** for the highest accuracy (by using two detectors) when feed on demand is required. **Then Apply** feeds a label when actuator is at Home position, then applies immediately.

E-Tamp will be chosen for this application.

Yes will offset the label placement from the front. If the product lengths vary, and the label needs to be placed off of the trailing edge of the product, set to No.
SMART MENU - Enter SMART Menu from the Setup Menu.

Determines if the system is being used with the optional Label Present sensor.

Determines measurement units (Standard or Metric).

Determines how many times the label will be fed without an application. The available options are 1, 2, 3 and Infinite. To ensure a 1 Label to 1 Product match, set this to 1.

Provides a warning if the system is online with a prior label on the tamp pad. Helps avoid a potential label to product mismatch.

Determines how many times the system will attempt to apply the same label. The available options are 1, 2, 3 and Infinite. To ensure a 1 Label to 1 Product match, set this to 1.

SETUP/JOB MENU - Enter JOB Menu from the Setup Menu.

No disables the Blow function (E-TAMP). On Sensor only activates the Blow function when the product is detected by Auto Retract Sensor. On Retract activates the Blow function when the actuator is returning due to Apply Duration expiring.

Keep as small as possible by locating the product sensor as close to the peel blade as possible. Exception - if print on demand is used.

Controls the extension stroke time. Set Auto-Retract to zero to properly adjust this time, then re-enable Auto Retract.

Most E-Tamp applications will not need much Home Delay. Large label sizes will benefit with a minimal delay of 20 mS to 100 mS.

If installed, the Auto-Retract (AR) time depends on the Actuator Speed. Typical values range from 1 mS to 100 mS.
**ACTUATOR SETUP MENU**

Press **ACTUATOR SETUP** from the SETUP/JOB Menu.

Sets the furthest extension of the tamp for the application with steps of one inch. Set distance just short of the product to blow label to the product.

Sets the furthest extension of the tamp with 6mm (1/4”) steps.

Sets the overall speed of the Actuator to five discrete values.

If enabled, the pad vibrates during label feed to help thicker labels or with stronger adhesive feed on the pad properly.

Vacuum Speed should be **Med_High** or **High**.

Sets how long the actuator should hold the same position once it reaches the first of these conditions: Apply Duration expired, Auto Retract sensed, Distance Limit threshold reached.

**Note:** Use this delay to keep the tamp pad at a fixed distance while the blow function is operating. A value between 50 mS and 100 mS makes the blow more effective.
**High Speed Tamp Mechanical Setup**

**ALIGN TO PEEL BLADE**

1. Loosen the two screws on the dovetail slider (A).

2. Slide assembly toward and away from the drive module until there is approximately 3.2mm (1/8") gap between the drive module peel blade and tamp pad edge.

3. Tighten the two screws (A).

**ALIGN LABEL WITH TAMP PAD**

1. Loosen the two screws on the L-bracket (B).

2. Slide the assembly toward and away from the baseplate until a fed label will cover the label present sensor.

3. Tighten the two screws on the L-bracket (B). Keep the actuator parallel to the baseplate during tightening.

**ALIGN TAMP PAD HEIGHT**

1. Loosen the set screw (D).

2. Adjust the bumper height (C) by turning the bumper so that the face of the peel blade is 1.6mm (1/16") **BEYOND** the peel blade.

3. Tighten the set screw (D).

4. Loosen the screws (E).

5. Slide the roller to set angle. The pad face should be level to the bottom edge of the baseplate.

6. Tighten the screws (E).
**High Speed Tamp Parameter Setup**

High Speed Tamp (HST) applications allow the label to be placed on the Top or Side of a product. Typically, this application method allows for line speeds higher than a standard tamp module can handle. The actuator extends the pivoting plate down to the product and holds this position to allow the product to receive the label via the roller.

Alternatively, the HST can be used to follow the contour of the product. The same principles apply: the plate should not be setup to make flat contact with the product, but rather stop short, hold position, and let the pivoting-action of the tamp plate glide along the product’s surface.

**LABEL MENU** - Enter LABEL Menu from the Home Screen.

- **Std** for rectangular labels with 3,2mm (1/8”) gap or **Odd** for any shape label that passes gap sensor.

  Sets the amount of tension applied to the rewind on a feed cycle. Set lower for speeds less than 51cm/s (100 FPM) or labels shorter than 101,6mm (4”).

  Sets the distance the liner has to travel after the gap for the next label to align at the edge of peel blade. For standard labels usually set to 12,7mm to 19,1mm (0.5” to 0.75”).

  Determines the label generation mode. For slow applications, like pallets, make this **P1 Detect**. This will reduce the time the label adhesive is exposed to air and drying. For highest throughput, use **At Home**. Use **P2 Detect** for the highest accuracy (by using two detectors) when feed on demand is required. **Then Apply** feeds a label when actuator is at Home position, then applies immediately.

  Depends on the product speed and PPM. Set for fastest throughput for the application.

**SYSTEM MENU** - Enter SYSTEM Menu from the Setup Menu.

- **HS-Tamp** will be chosen for this application.

  **Yes** will offset the label placement from the front. If the product lengths vary, and the label needs to be placed off of the trailing edge of the product, set to **No**.
SMART MENU - Enter SMART Menu from the Setup Menu.

- Determines if the system is being used with the optional Label Present sensor. Provides a warning if the system is online with a prior label on the tamp pad. Helps avoid a potential label to product mismatch.

- Determines measurement units (Standard or Metric). Determines how many times the system will attempt to apply the same label. The available options are 1, 2, 3 and Infinite. To ensure a 1 Label to 1 Product match, set this to 1.

- Determines how many times the label will be fed without an application. The available options are 1, 2, 3 and Infinite. To ensure a 1 Label to 1 Product match, set this to 1.

SETUP/JOB MENU - Enter JOB Menu from the Setup Menu.

- Keep as small as possible by locating the product sensor as close to the peel blade as possible. Exception - if print on demand is used. Most E-Tamp applications will not need much Home Delay. Large label sizes will benefit with a minimal delay of 20 mS to 100 mS.

- Controls the extension stroke time. Set Auto-Retract to zero to properly adjust this time, then re-enable Auto Retract. If installed, the Auto-Retract (AR) time depends on the Actuator Speed. Typical values range from 1 mS to 100 mS.
ACTUATOR SETUP MENU

Press **ACTUATOR SETUP** from the SETUP/JOB Menu.

If enabled, the pad vibrates during label feed to help thicker labels or with stronger adhesive feed on the pad properly.

Sets the furthest extension of the tamp for the application with steps of one inch. Use this limit if the product distance to the labeler is consistent.

Sets the furthest extension of the tamp with 6mm (1/4”) steps.

Sets the overall speed of the Actuator to five discrete values.

See chart below for recommended setting:

</table>

Sets how long the actuator should hold the same position once it reaches the first of these conditions: Apply Duration expired, Auto Retract sensed, Distance Limit threshold reached.

**Note:** For CONTOURING APPLICATIONS use the Distance Limit to set the fixed position to pivot from and increase the Hold Delay to apply all of the label. May need to increase Apply Duration to keep actuator in position for the whole Hold period.

**Note:** For HIGH-SPEED APPLICATIONS minimize stroke length and hold time. Keep the tamp plate engaged to the roller bumper, and extend just long enough to pivot. Lower Actuator Speeds are better for this action.
E-FASA Mechanical Setup

PEEL BLADE GAP ADJUSTMENT

1. Loosen the four screws on the dovetail slider (A).
2. Slide assembly toward and away from the peel blade until there is approximately 3.2 mm (1/8") gap between the peel blade and tamp pad edge.
3. Tighten the four screws (A).

BASEPLATE ADJUSTMENT

1. Loosen the four screws on the L-bracket (B).
2. Slide E-FASA assembly toward and away from the baseplate until a fed label will cover the label present sensor.
3. Tighten the four screws on the L-bracket (B).

HEIGHT POSITION ADJUSTMENT

1. Loosen the jam nut (C).
2. Set height by rotating bumper rod (D).
3. Adjust the tamp pad height to 1.6 mm (1/16") **BEYOND** the peel blade.
4. Check home position by powering up the system.
5. Tighten the jam nut (C).
PAD ANGLE ADJUSTMENT
1. Loosen the jam nut (E).
2. Tighten or loosen the bumper (F) to rotate the pad, making it parallel with the baseplate.
3. Tighten the jam nut (E).

PIVOT SPRING TENSION ADJUSTMENT
1. Loosen bolt (G).
2. Slide the bracket closer or further from the rod end to loosen or tighten the spring.
3. Tighten bolt (G).
4. Test label application. Pad should not “slap” the product when labeling.

HOME SENSOR ADJUSTMENT
1. Loosen set screw (H).
2. With arm in home position, slide home sensor toward machine and then slowly slide it away from the machine until the light turns on.
3. Tighten set screw (H) to 0,68-0,90 N-m (6-8 LB-IN).
4. Verify that the home sensor light turns off when the pad is moved about 25,4mm (1”) away from the home bumper.
E-FASA Parameter Setup

The E-FASA application module allows for either one or two product panel applications. In single label applications, either the front or rear panels can be labeled. In dual label applications, either the front and side or side and rear panels can be labeled.

**LABEL MENU** - Enter LABEL Menu from the Home Screen.

- **Std** for rectangular labels with 3,2mm (1/8") gap and **Odd** for any shape label that passes gap sensor.
- Sets the amount of tension applied to the rewind on a feed cycle. Set lower for speeds less than 51cm/s (100 FPM) or labels shorter than 101,6mm (4").
- Depends on the product speed and PPM. Set for fastest throughput for the application.

- Determines the label generation mode. For slow applications, like pallets, make this **P1 Detect**. This will reduce the time the label adhesive is exposed to air and drying. For highest throughput, use **At Home**. Use **P2 Detect** for the highest accuracy (by using two detectors) when feed on demand is required. **Then Apply** feeds a label when actuator is at Home position, then applies immediately.

- Sets the distance the liner has to travel after the gap for the next label to align at the edge of peel blade. For standard labels usually set to 12,7mm to 19,1mm (0.5” to 0.75").

- **Std** for rectangular labels with 3,2mm (1/8") gap and **Odd** for any shape label that passes gap sensor.

**SYSTEM MENU** - Enter SYSTEM Menu from the Setup Menu.

- Set to the length of the actuator. **Note**: This is an important setting, since it regulates the overall speed of the arm. Faster speeds are allowable for the 12cm (5") arm and reduced for the 25cm (10") and 50cm (20"). Proper function of the system requires the correct match of the Actuator Length and the physical length of the E-FASA arm. The length of the E-FASA is the usable length of the arm, measured between the baseplate edge and the tamp pad center. For 19cm (7.5’), set to 25cm (10’); for 38cm (15’), set to 50cm (20”).

- E-FASA will be chosen for this application.

- Yes will offset the label placement from the front. If the product lengths vary, and the label needs to be placed off of the trailing edge of the product, set to **No**.
SMART MENU - Enter SMART Menu from the Setup Menu.

Determines if the system is being used with the optional Label Present sensor.

Determines how many times the label will be printed/fed without an application. The available options are 1, 2, 3 and Infinite. To ensure a 1 Label to 1 Product match, set this to 1.

Provides a warning if the system is online with a prior label on the tamp pad. Helps avoid a potential label to product mismatch.

Determines how many times the system will attempt to apply the same label. The available options are 1, 2, 3 and Infinite. To ensure a 1 Label to 1 Product match, set this to 1.

SETUP/JOB MENU - Enter JOB Menu from the Setup Menu.

If the application requires two labels, front and side panels, this delay can be kept minimal. If the application is side and rear panels, the product sensor will have to be relocated, and delay will therefore need to increase.

Should be incrementally set from low values to higher values to adjust the contact point with the product. For the front or rear panels, the optimum contact point is a little beyond 90 degrees. This allows the pad to pivot, and place the label squarely on the product.

Not very useful for the front and rear panels, but mainly used for the side application. Values between 1 mS and 50 mS are typical.

Most E-FASA applications benefit from some minimal delay between 50 mS to 200 mS, to allow the pad to settle when arriving home.

Should be greater than the time required to print two labels (if using Make Label PD Sensor 1 or 2) or print one label (Make Label = At Home mode) plus the first apply cycle.

Values between 1 mS and 50 mS are typical.

Same as Apply Duration.
ACTUATOR SETUP MENU

Press ACTUATOR SETUP from the SETUP/JOB Menu.

Sets the furthest swing angle for this application.

Note: Use this limit for the front or rear panel swing (typically 90 degrees). Can be used in conjunction with the Hold Delay to swing out and wait for the product's front panel. If Hold Delay is long enough, will perform a corner wrap on product.

Sets the overall speed of the Actuator to five discrete values.

If enabled, the pad vibrates during label print/feed to help thicker labels or with stronger adhesive feed on the pad properly.

Sets how long the actuator should hold the same position once it reaches the first of these conditions: Apply Duration expired, Auto Retract sensed, Angle Limit threshold reached.

See the chart below for recommended setting:

E-WASA Mechanical Setup

ADJUST “X” POSITION

1. Loosen the two screws on the slider track (A).
2. Slide the WASA module until there is approximately 3,2mm (1/8") between the peel blade and the edge of the Fan Box.
3. Tighten the screws (A).

ADJUST “Y” POSITION

1. Loosen the two screws (B).
2. Feed a label out to the fan box.
3. Label should dispense within 3,2mm (1/8") of raised edge, but NOT on the raised edge.

ADJUST ROTATION ANGLE “Z” POSITION

1. Loosen two nuts (C) on the cylinder.
2. Turn the cylinder body to thread the rod in or out of the coupling to adjust the “Z” rotational position of the Fan Box.
3. Adjust the rotation so that the label feeds out to the Fan Box without stalling on the surface of the face.
4. Tighten both nuts (C) and feed a few labels to determine if the position is ideal.
ADJUST SPRING RATE

1. Loosen the jam nut with a 13mm open-end wrench.

2. Turn the Screw Adjustment clockwise to increase the spring force, and counterclockwise to reduce it. Products that are under 2.3~4.5 kg (5~10 lbs) require less spring force to allow the label to be wrapped without making the product stall on the conveyor. Too light of a spring tension will result in a poorly wrapped label. The full range of spring tension is accomplished within a 50.8mm (2”) screw threading distance.

WARNING: Do not decrease the spring tension so far that the WASA Fan Box does not consistently return home. If the spring is too weak, friction and product placement will begin to effect the performance of the label wrap.

NOTE: The E-WASA is highly dependent on a rear guide rail for optimal performance. Since the E-WASA is spring-loaded to apply pressure to the front and side of the product, the guide rail prevents possible product skew. Operation without the proper material handling will result in poor wrap angle or label wrinkle.

3. When the WASA travel has been checked for the swing range of motion, lock in the spring tension position by tightening the jam nut.

ADJUST RETURN FLOW CONTROL

Loosen the thumb wheel jam nub and turn the flow control clockwise to reduce the speed that the WASA returns to the home position. Increase the flow by turning the control counterclockwise, which will allow the WASA box to return home faster.

WARNING: The adjustment on the return speed will determine the maximum throughput rate. If the application can tolerate a slower return rate, it will result in a smoother and gentler return, which will result in longer life.

NOTE: The E-WASA is highly dependent on a rear guide rail for optimal performance. Since the E-WASA is spring-loaded to apply pressure to the front and side of the product, the guide rail prevents possible product skew. Operation without the proper material handling will result in poor wrap angle or label wrinkle.
E-WASA Parameter Setup

E-WASA applications allow the label to be placed on two adjacent panels, typically front and side, but front and top is also possible. Since the E-WASA cannot accept the next label until the arm returns home, it is a label print on demand by default.

LABEL MENU - Enter LABEL Menu from the Home Screen.

**Std** for rectangular labels with 3.2mm (1/8”) gap and **Odd** for any shape label that passes gap sensor.

Sets the amount of tension applied to the rewind on a print cycle. Set lower for feed speeds less than 51cm/s (100 FPM).

Sets the distance the liner has to travel after the gap for the next label to align at the edge of peel blade. For standard labels usually set to 12.7mm to 19.1mm (0.5” to 0.75”).

SYSTEM MENU - Enter SYSTEM Menu from the Setup Menu.

Sets the rewind motor direction.

E-WASA, if there is no Home Sensor and **E-WASA+**, if there is a Home Sensor.

SETUP/JOB MENU - Enter JOB Menu from the Setup Menu.

Determines the amount of time to delay from the product detector trigger to the label printing. Usually kept at a minimum value.
7000 Series Label Applicator

Appendix B: Application Methods

WIPE Mechanical Setup

ANGLE ADJUSTMENT

1. Loosen Rotator Screw (A).
2. Adjust angle.
3. Tighten Rotator Screw (A).

NOTE: Increase the angle to the product (more parallel feeding of label to product’s surface) for surfaces that have an outward bow. Decrease the angle to the product (more perpendicular to the product’s surface) for recessed areas or plastic-based labels that tend to trap air pockets.

NOTE: Using an angle less than 20° or greater than 45° can cause label misplacement or unnecessary wear on applicator.

BRUSH ANGLE AND POSITION ADJUSTMENT

The brush should be positioned at the point where the label will make contact with the product.

1. Loosen the brush clamp handle (B).
2. Position the brush to match the point of contact between the label and the product.
3. For short labels, the brush should be positioned next to or contacting the peel blade (product will push bristles back when in contact).

NOTE: If the brush is positioned too far away from the merge point, the label position consistency can change due to label slippage. In addition, the brush can curl up the front edge and, in certain conditions, can remove the label.
**WIPE Parameter Setup**

Wipe application allows for pre-printed standard and irregular labels to be applied at maximum speed of 150 cm/s (300 FPM).

**LABEL MENU** - Enter LABEL Menu from the Home Screen.

- **Std** for rectangular labels with 3.2mm (1/8") gap or **Odd** for any shape label that passes gap sensor.

- The distance liner has to travel after gap for the next label to align at the edge of peel blade. For standard labels usually set to 12.7mm to 19.1mm (0.5" to 0.75").

- **PRODUCT DETECTOR**

- Sets the amount of tension applied to the rewind on a feed cycle. Set lower for speeds less than 51cm/s (100 FPM) or labels shorter than 101.6mm (4").

- Depends on the product speed and PPM. Set for fastest throughput for the application.
SYSTEM MENU - Enter SYSTEM Menu from the Setup Menu.

Sets the rewind motor direction.

Wipe is used for this application.

Typically leading edge product triggers will offset the label placement from the front. If the product lengths vary, and the label needs to be placed off of the trailing edge of the product, set this value to No.

SETUP/JOB MENU - Enter JOB Menu from the Setup Menu.

Determines the amount of time to delay from the product detector trigger to label feeding. The setting depends on feed speed and label placement on the product, but is usually kept at a minimum value.
